It is our pleasure to publish the first issue of this journal. The journal adds in scientific contribution of original articles, reviews, editorial, case reports and book reviews. It may be a question in the mind of the reader about justification of starting a new journal where so many are available since years. As name of the journal suggests present journal will participate to gather different faculties from different disciplines of medical science in association of public health for better patient care. There are so many issues where there is a need of involvement of multi-discipline to solve or understand a specific issue. It may be from the area of basic medical sciences to clinical and recent advances in different fields. A single journal will try to solve many problems arises regularly. Medical practitioners feel it difficult to solve by using routine available knowledge. There may be dealing of an individual patient or an epidemic.

The editing process will be carried out with as much diligence and attention to details to help the committee and ultimately to medical community. We expect a continual submission of articles of high standards of original work, reviews of correct and recent events and advances in various fields of medicine as a whole.

We also invite brief reports, case reports and letters to the editors for quick reporting of

preliminary observations or comments on previously published papers.

The growing concern of publication has assumed significance, not only to be at the front in reporting the recent technology or event but also as a necessary to further ones carrier. For development of carrier puts pressure to publish the articles hurriedly collecting study material to write up a research paper. We expect quality manuscripts to maintain good scientific standards. Let international and national bodies participate to achieve a high impact from and wide relationship in reverence to all branches of medical field. The selection criteria for acceptance of manuscripts will remain stringent through screening process and per reviews.

Innovative techniques and methods must be accompanied by comparison with standard procedures. Authors must take care of ethical guidelines. Scientifically analyzed epidemiological data will definitely help to understand the dissemination pattern of various diseases and outbreaks.

This is a first step by the journal at the goal of “journey of thousand miles” and I hope a first step kept in right direction will definitely help us to reach the goal that is “better patient care”.
